

1. Why Gauss elimination does not change the null space of matrix A?

let M be the product of elementary matrixes of A.

- suppose $x \in N(A)$, so $Ax = 0$. we have:

$$MAx = M(Ax) = M \cdot 0 = 0$$

so $x \in N(MA)$ as well.

- suppose $y \in N(MA)$, so $(MA)y = 0$. we have:

$$Ay = M^{-1}MAy = M^{-1} \cdot 0 = 0$$

so $y \in N(A)$ as well.

That means when you apply Gauss elimination, you do change the solution space.

2. Why every elementary is invertible?

https://en.wikipedia.org/wiki/Elementary_matrix

<https://math.vanderbilt.edu/sapirmv/msapir/prleelementary.html>

3. If n vectors are independent, is their span \mathbb{R}^n ?

Yes. Here is why:

Proposition. Let W be a subspace of a finite-dimensional vector space V. If $\dim(W) = \dim(V)$, then $W=V$.

If we are given linearly independent $\{v_1, \dots, v_n\} \in \mathbb{R}^n$, then $\text{span}\{v_1, \dots, v_n\}$ is an n-dimensional subspace of \mathbb{R}^n . Since $\dim(\mathbb{R}^n) = n$, the proposition implies that $\text{span}\{v_1, \dots, v_n\} = \mathbb{R}^n$

4. Proof: A invertible \Leftrightarrow A's columns are independent & A is squared.

$A = [v_1, v_2, v_3, \dots, v_n] : v_i \text{ is column vector}$

- Suppose A is invertible \Rightarrow A is squared

$$Ax = 0 \Leftrightarrow A^{-1}Ax = A^{-1}0 \Leftrightarrow x = 0$$

\Rightarrow q.e.d

- Suppose A's columns are independent & A is squared.

$\{v_1, v_2, \dots, v_n\}$ are independent $\Rightarrow \{v_1, v_2, \dots, v_n\}$ is a basis of \mathbb{R}^n (see Q3). So:

$$I_n = A * \begin{bmatrix} b_{1,1} & \dots & b_{1,n} \\ b_{2,1} & \dots & b_{2,n} \\ \dots & & \\ b_{n,1} & \dots & b_{n,n} \end{bmatrix} = A * B \Rightarrow B = A^{-1}$$

5. Proof: A's columns are independent $\Rightarrow A^T A$ invertible.

- $A^T A$ is squared.
- A's columns are independent $\Leftrightarrow N(A) = \{0\}$. Let $\vec{v} \in N(A^T A)$. We have:

$$\begin{aligned}
& A^T A \cdot \vec{v} = \vec{0} \\
\iff & \vec{v}^T A^T A \vec{v} = \vec{v}^T \cdot \vec{0} = 0 \\
\iff & (A\vec{v})^T \cdot (A\vec{v}) = 0 \\
\iff & A\vec{v} = \vec{0} \\
\iff & \begin{cases} \vec{v} = \vec{0} \\ \vec{v} \in N(A) \end{cases} \\
\iff & N(A) = N(A^T A) = \{\vec{0}\}
\end{aligned}$$

=> q.e.d

6. Proof: Orthonormal set of vector are independent.
